

Item Code EB5 Heating Element

240v 2.4Kw

Fitting Instructions

Remove old element and check that the vessel is not damaged.

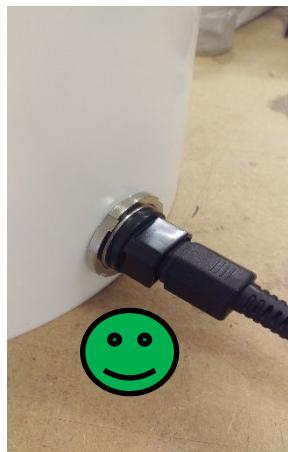

Fit new element with the seal on the inside. Tighten the collar by hand and then fill the vessel with water to test for leaks. **Do not connect to the power supply whilst doing this test.** If no leaks are present, the bin can be connected ready for use.

If fitting into a new vessel, drill a 40mm diameter hole, ensuring the edge is clear of burrs.

Always clean the element thoroughly after use to prevent burning which may affect the taste of your beer.

- Do not operate dry
- Ensure element is fully submerged before switching on
- Risk of electric shock if incorrectly installed
- This product must be earthed. Ensure it is connected using a suitable earthed mains lead and that the plug is fully inserted before use.
- For use with liquids only

Please ensure plug is fully inserted into element to prevent poor connection and overheating

Please note: The heater tube is manufactured from stainless steel, and the mounting boss is Nickel plated copper. The two parts are brazed together, and this leaves some marking which may be mistaken as corrosion. The marking is normal and will not affect the element in any way.
